

Prairie Restoration Efforts

Seeds for a variety of native prairie plants were broadcast in this area during late winter. Now it is being mowed in spring and early summer to suppress the brome grass and allow later-maturing native species to grow.

Closer to the mound, the path enters a large area burned on April 26 to encourage native species and discourage non-natives.

The different looking area on the eastern slope (to the right of the summit from here) was a feedlot for many years and has so far resisted efforts to establish a prairie. Work and research is continuing to overcome this problem.
